IMPORTANT INFORMATION. READ BEFORE USING.

Pack Rabbit's composite frame systems are constructed of glass-filled, injection molded nylon, which makes them extremely strong, lightweight, and flexible. They are designed to carry significant amounts of weight. However, like any product they can be damaged under certain conditions.

IMPROPERLY SECURED CARGO CAN CAUSE DAMAGE TO THE FRAME.

For heavier loads (greater than 30-lb) use straps to secure your load. **DO NOT** use bungee or other stretchable materials to secure your heavy load. **ALWAYS** strap your load back to the upper part of the main frame. The *Cargo Deck* is designed to maintain the position of the load above the hips. It **IS NOT** intended to bear all of the weight alone.

The peripheral anchor points along the main part of the frame are extremely strong and intended to bear the majority of the weight. Route straps through the anchor points and around your load vertically and/or horizontally to secure it back to the main frame.

The *Cargo Deck* **IS NOT** intended to be a seat and should not be used as a seat or child carrier. The flip-down feature of the *Pivoting Lumbar Support* is the only recognized *Low-Profile Seat* on the frame.

FOR LARGE FRAMES ONLY. **Before each use**, inspect the *Easy-Grip Knobs* to ensure they are hand-tight. Periodically recheck and tighten as required. *Loctite™* may be used to prevent the knobs from becoming loose.
